Vulnerability Details			
(All below are mandatory fields)			
Title of Vulnerability			
Acquiring the list of SUPI stored in the database of 5GC UDM			
Description of Vulnerability			
According Annex A.1 of 3GPP TS 24.501, the 5GMM cause, Cause #3 – Illegal UE, is sent to the UE when the network refuses service to the UE either because an identity of the UE is not acceptable to the network or because the UE does not pass the authentication check.			
Therefore, the UE will receive Registration Reject with Cause, Illegal UE, after sending Registration Request with SUPI, which the value is not found in the database of UDM.			
			
			

Figure 1: SUPI is not found in UDM

According 4.4.4.2 of 3GPP TS 24.501, except the messages listed below, no NAS signalling messages shall be processed by the receiving 5GMM entity in the UE or forwarded to the 5GSM entity, unless the network has established secure exchange of 5GS NAS messages for the NAS signalling connection: ... b) AUTHENTICATION REQUEST; ...

Therefore, the UE will receive Authentication Request after sending Registration Request with SUPI, which the value is found in the database of UDM.

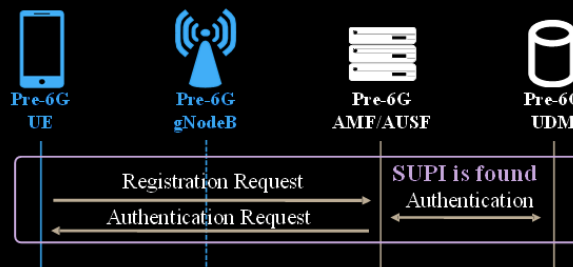

Figure 2: SUPI is found in UDM

The attacker could acquire the list of SUPI stored in the database of 5GC UDM by recently sending Registration Request with increased value of SUPI. For non-public network (NPN), there are a few SUPI stored in the database of 5GC UDM, therefore the attacker could perform future attack to UE in the list of SUPI.

The following test is performed over N1 interface via N2 Interface of gNB/UE emulator. The same result will be obtained over N1 interface via NR-Uu air interface of UE emulator.

Figure 3: Demonstration of Acquiring the list of SUPI stored in the database of 5GC UDM

Suggested Mitigation:

The 5GC should send Authentication Request instead of Registration Reject with Cause, Illegal UE to UE, after receiving Registration Request with SUPI, which the value is not found in the database of UDM. And then sending Authentication Failure to UE, after receiving Authentication Response from UE.

Product or Service Name	5GC

RE: CVD: Acquiring the list of SUPI stored in the database of 5GC UDM for non-public network (NPN)

Hi Lucas,

Thank you for your email. The CVD panel feel they now have enough information to assess the case fully and would like to thank you for bringing this to their attention. They also feel that the problem as well as the proposed mitigation. Their conclusion is that the case is identical to the one studied in 3GPP TSGS RAN WG2 #90, which was found to be less criticality than the actual problem it tries to solve. This is in line with the conclusion drawn by 3GPP as well. The panel sees no justification for changing the procedure to change the specification.

The enumeration has been present in all mobile technologies, starting with 2G, therefore it shall be considered acceptable for the current mobile network.

An update may be needed is an update to a GSMA document as we feel the issue you mentioned cannot be documented very well. It is important to be aware of this risk during planning and deployment of a mobile network.

Finally, we continue to work on our 2 other CVD cases on N4 interfaces and False base stations and expect to be back in contact soon on those.

Hi Lucas,

Thank you very much for the CVD panel feel they now have enough information to assess the case fully and would like to thank you for bringing this up.

They also feel that there is no justification for starting the procedure to change the specification as it would bring its own problems and risk of running a mobile network.

The problem as well as the proposed mitigation. Their conclusion is that the case is identical to the one studied in 3GPP TSGS1 R4-07-0069. The panel sees no justification for starting the procedure to change the specification as it would bring its own problems and risk of running a mobile network.

This is in line with the conclusion by 3GPP as well. The panel sees no justification for starting the procedure to change the specification as it would bring its own problems and risk of running a mobile network.

2G

Therefore it shall be considered a low risk of running a mobile network.

There has been enumeration has been present in all mobile technologies, starting with 2G.

It may be needed is an update to a GSMA document as we feel the issue you talk of cannot be documented very well. It is not clear if this is planning and deployment of a mobile network or are aware of this risk.

Finally, we continue to address our 2 other CVD cases on N4 interfaces and False base stations and expect to be back in contact soon on those.

Kind Regards,
Roger Brown

Security Services Manager

Proposal for Discussion on Prevent acquiring the list of SUPI at the SA3 #116

3K 3GPP [redacted]
To: +1 other
Cc: [redacted] +4 others
Sat 5/11/2024 7:57 PM

Dear [redacted],

Thank you for your guidance on the SUPI attack issue. Following your suggestion, I have prepared a contribution for the **SA3 #116** meeting, focusing on enhancing security against SUPI guessing attacks, especially under null-scheme conditions in NPN environments.

The proposal is titled "Prevent acquiring the list of SUPI stored in the database of 5GC UDM" and has been submitted for discussion at the upcoming SA3 meeting. It suggests modifications to 3GPP TS 24.501 to mitigate risks by potentially issuing a Registration Reject under specific conditions.

I would appreciate your insights and any further recommendations on this matter. The document can be accessed here for a more detailed view:
https://www.3gpp.org/ftp/TSG_SA/WG3_Security/TSGS3_116_Jeju/Docs/S3-241712.zip.

Best regards, [redacted]

Dear [redacted],

Thanks for sharing the discussion paper. Observation 1 is related to the interaction with PLMN NPN. Since I have UE impacts, I am not sure if PLMN NPN is the right place to discuss this.

BR, [redacted]

Dear [redacted],

Thank you for your feedback on our discussion paper. I would like to clarify an important aspect of our proposal. The focus of the security enhancements discussed, particularly regarding the integrity of the SUPI list in the 5GC UDM database, is strictly on strengthening the network's defenses against potential security threats.

Our proposal does not advocate for changes to UE behavior or interactions. Instead, it aims to enhance the security measures at the network level, such as implementing robust encryption and improving access controls. These measures are designed to protect the network and its users without altering how UEs operate or interact within the network.

We believe this clarification helps align our discussion with the intended scope of enhancing network security without impacting UE functionalities. We believe that discussing the practical implementation of these security measures would be highly beneficial and would appreciate if we could explore this further in a CT1 session to align our approach effectively.

Best regards, [redacted]

3GPP TSG-SA3 Meeting #116
Jeju, South Korea, 20th - 24th May 2024

S3-241712

Source: ISSDU, III, NYCU
Title: Prevent acquiring the list of SUPI stored in the database of 5GC UDM
Document for: Discussion
Agenda Item: 5.3

1 Decision/action requested

Endorse the proposal and recommend CT1 to modify 3GPP TS 24.501 based on the observation in this contribution.

2 References

- [1] 3GPP TS 33.501, Security architecture and procedures for 5G system; (Release 18)
- [2] 3GPP TS 24.501, Non-Access-Stratum (NAS) protocol for 5G System (5GS); Stage 3 (Release 18)

3 Rationale

In accordance with 3GPP TS 33.501, null-scheme should be implemented such that it returns the same output as the input, which applies to both encryption and decryption. This ensures that when using the null-scheme, the SUCI (Subscription Concealed Identifier) does not conceal the SUPI (Subscription Permanent Identifier) and therefore the newly generated SUCIs do not need to be fresh, maintaining the network's integrity and preventing unauthorized access.

The concerns highlighted in Annex A.1 of TS 24.501, particularly regarding Cause #3 – Illegal UE, when the network refuses service to the UE either because an identity of the UE such as SUPI is not acceptable to the network or because the UE does not pass the authentication checks. However, these issues are not thoroughly addressed the security of the context in UDM database, especially for NPN, where the risk of multi-UE, under null-scheme conditions considering Registration Reject, could be more pronounced.

Refer to Section 4.4.4.2 of TS 24.501, NAS signaling messages received by the 5GMM entity within the UE, or relayed to the 5GSM entity, should not be processed, except when a secure exchange of 5GS NAS messages has been established for the NAS signaling connection, specifically including the Authentication Request message.

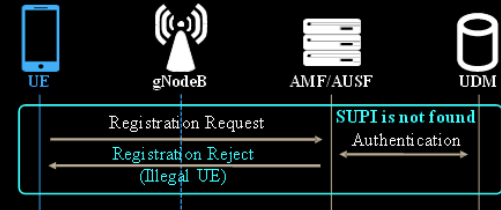

Figure 1: SUPI is not found in UDM

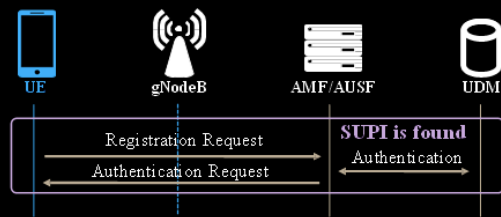

Figure 2: SUPI is found in UDM

These figures illustrate the difference between cases where the UDM has the SUPI of the UE and where it does not. The SUPI is a globally unique identifier for the subscriber that can be either concealed or not concealed by the UE. When the UDM possesses the SUPI, it can authenticate the UE and authorize network access. When the UDM does not have the SUPI, it needs to request it from another UDM.

In the simulation, a Registration Request containing SUPI is sent through the N1 interface via the N2 interface from a gNB/UE emulator. Identical results are achieved when sending a Registration Request with SUPI through the N1 interface via the NR-Uu air interface from a UE emulator.

(a) Demonstration of filed Test (b) Evidence of pcap log
Figure 3: Acquiring the list of SUPI stored in the database of 5GC UDM

Test results from gNB/UE emulators using N1 and N2 interfaces show that the integrity of the SUPI list in the 5GC UDM database is susceptible to malicious attacks in NPN configurations. Specific adjustments to the Registration Request message and enhanced security measures are crucial to reduce cybersecurity risks.

TS 24.501 should clarify that robust encryption and improved access control significantly reduce the risk of SUPI threats, as demonstrated by tests on the NR-Uu air interface with UE emulators. Ensuring the security of the SUPI list is essential as it protects customer information, prevents unauthorized network access, and preserves the uniqueness of each customer. Under conditions applying the null-scheme, considering a Registration Reject scenario, enhancing the protection of the SUPI when concealed is necessary to secure the data from unauthorized access.

Observation1: The risk of attacks on the SUPI list in 5GC UDM databases shows the need for stronger security, like better encryption and access control. These steps are important to keep subscriber information safe and ensure data safety in the network, especially with the null-scheme.

In NPN scenarios, the application of the null-scheme exposes a significant security vulnerability by not encrypting the SUPI. To mitigate this risk, it is recommended that when a registration request is received using the null-scheme, the network should promptly issue a Registration Reject response. Therefore, under conditions applying the null-scheme and considering a scenario of NPN, the UE will only receive an Authentication Request if the SUCI is found in the UDM database.

NPN network to reject a registration request if it uses the null-scheme might not be the best way. This could wrongly block real users from accessing the network, which would make their experience worse and slow down the network. It is crucial to develop more nuanced mechanisms that distinguish between genuine security threats and normal user requests to minimize unnecessary disruptions and maintain robust network performance.

Observation2: We should get support from SA3 and keep the discussion going in CT1 to make sure we find a balance between keeping the network safe and keeping it user-friendly.

Proposal: 3GPP TS 24.501 should specify that in order to prevent acquiring the list of SUPI stored in the database of 5GC UDM, the NPN network should send Registration Reject with Cause #3 (Illegal UE) after receiving the Registration Request using the null-scheme.

4 Conclusion and Proposal

Observation 1: The risk of attacks on the SUPI list in 5GC UDM databases shows the need for stronger security, like better encryption and access control. These steps are important to keep subscriber information safe and ensure data safety in the network, especially with the null-scheme.

Observation2: We should get support from SA3 and keep the discussion going in CT1 to make sure we find a good balance between keeping the network safe and keeping it user-friendly.

Proposal: 3GPP TS 24.501 should specify that in order to prevent acquiring the list of SUPI stored in the database of 5GC UDM, the NPN network should send Registration Reject with Cause #3 (Illegal UE) after receiving the Registration Request using the null-scheme.

Why we need migration to QSC? (3GPP SA1#106 Meeting)

📶 As specified in clause 6.12.2 of 3GPP TS 33.501, the SUCI is generated using a protection scheme such as **Elliptic Curve Integrated Encryption Scheme (ECIES)** with the Home Network public key.

📶 The main vulnerability of the ECIES protocol with respect to the quantum threat is actually the **Diffie-Hellman key exchange** step, regardless of the used profile.

3GPP SA1#106 Meeting (email discussion)

et
This is Steve [redacted] "GE Network Technologies" in 3GPP SA1. I was interested in the 3GPP agenda item as it relates to QKD. We would be happy to discuss this topic with you. TCON. Let me know if you would be interested in following up via Teams perhaps?

Dear [redacted],

Thank you for reaching out and expressing interest in our 3GPP agenda item related to QKD. We are very interested in discussing this topic with you and would like to arrange a Teams meeting. Given the potential time difference, could you please provide some available times for you? We will do our best to accommodate your schedule. Looking forward to your response.

Best regards,
[redacted]

[redacted]

Sorry for my confusion, I also sent a Teams invitation for ET Fri 5/24 8AM, which corresponds to TST Fri 5/24 8PM. I canceled it and will use yours.

Some questions to discuss:

- Who is endorsing this Study Item besides the following (they all seem to be from Taiwan)?
 - Information Security Service Digital United Inc.
 - Institute for Information Industry
 - National Yang Ming Chiao Tung University
- Can you include concerns about the complexity of classical Post-Quantum Cryptography being used in the appropriate for industrial (control system) use? A hybrid approach may have less overhead and provides warning of attacks.
- I think QKD will be tough to get adopted. Are you willing to help support it?
 - I think you need to get the big companies on board with the proposal? But either way, the discussion will be interesting.

We can talk more at our meeting.

Thanks,
[redacted]

Hi [redacted],

Thank you for your interest and support regarding the company's view for 6G. Here are my short responses to your questions:

1. **Supporters List:** We are actively seeking additional support from both international and local companies. We hope you can provide more suggestions and resources in this regard.
2. **Concerns about Classical Post-Quantum Cryptography:** We include these concerns in the proposal. The advantages of Quantum Key Distribution (QKD) in various scenarios, particularly its lower security risk and ability to provide warnings of attacks.

We are planning to revise the S1-241059 according to your suggestions and submit the new version to SA1. Your insights are invaluable, and we would like to invite you to co-source this contribution with us. Would you be available and willing to collaborate more closely on this?

Looking forward to discussing this further in our meeting.

Best regards,
[redacted]

You may also want to consider hybrid QKD/QSC – that is, a combination of post-quantum cryptography (classical) and QKD (quantum). This could be a 3rd topic area if you have any thoughts.

...just a thought.

Hi [redacted],

Thank you for suggesting hybrid QKD/QSC as a combination of post-quantum cryptography (classical) and QKD (quantum). I've added this to the proposal. I marked it as red.

If you think the hybrid approach is a good idea, we can propose it at the next SA1 meeting. I'm happy to discuss it.

I'll send the revised document to Alain for a new tdoc number. Thanks again for your suggestion.

Best regards,
[redacted]

Technical Manager, Ph.D
Network Technologies & Operations | EVP office

[DRAFT]Revision of S1-241059 - Enable Quantum-Safe Cryptography for 6G

Hi all,

I have revised S1-241059 to incorporate new ideas from GE Network Technologies. As a result, it has been assigned a new tdoc number: S1-241240.

The changes to the content (indicated by red text) are as follows:

- Addition of the idea from GE Network Technologies.
- Added a new section on page 7: "6G Quantum Key Distribution and Post-Quantum Cryptography (classical) and QKD (quantum)".
- Proposal: Consider the use of post-quantum cryptography (classical) and QKD (quantum).

I will upload the revised document to the inbox at the start of the meeting.

Best regards,
[redacted]

RE: [S1-241240]Revision Submission and Agenda Update

3K [redacted]

To: +1 other

Cc: 蔡宜學 Yi-Hsueh Tsai; +2 others

Thu 5/30/2024 11:02 AM

Hi [redacted],

Thank you for your email.

Regarding S1-241240 being "Noted," I wanted to update you on the developments from yesterday's report. Several companies were initially set to speak, but the chairperson stopped them, indicating that the discussion should be moved to SA3. However, we believe that SA1 is an appropriate forum to present usage requirements.

In the August SA1 meeting, a study item for 6G was established. I am considering whether GE Network Technologies could lead this effort with support from other major companies. We propose to start discussing use cases from November onwards.

Please let me know your thoughts on this approach and if there are any specific recommendations you would recommend.

Best regards,
[redacted]

Why we need migration to QSC? (3GPP SA1#107 Meeting)

📶 Therefore, we are concerned that the increasing complexity of implementing **PQC**, as this may be too slow and unacceptable for time sensitive **industrial control** system application.

📶 Introducing **Quantum Key Distribution (QKD)** technology could reduce overhead, shortens latency, and provides warnings of eavesdropper attacks.

Abstract - This study addresses key security challenges in managing the Subscription Permanent Identifier (SUPI) within 5G Non-Public Networks (NPNs). Existing 3GPP standards, optimized for public networks, leave private networks vulnerable to risks such as unauthorized SUPI access and systematic guessing attacks. To address these issues, we propose several enhancements, including adaptive access controls, measures to prevent the vulnerabilities associated with the null-scheme, and the adoption of post-quantum cryptography to safeguard sensitive subscriber data. Our methodology combines simulation-based vulnerability assessments with targeted countermeasures to reduce SUPI-related security risks. The results highlight a significant reduction in potential attack vectors, providing practical recommendations for improving privacy and data security within 5G NPNs. By aligning with ongoing 3GPP standardization efforts, our work offers a forward-looking framework to mitigate emerging threats, particularly as quantum computing becomes a critical concern.

Index Terms – SUCI, NPN, Security, Privacy, and PQ

INTRODUCTION

5G technology marks a significant leap forward in wireless communication, providing unprecedented data rates, reduced latency, and the capacity to support extensive device connectivity [1, 2]. This advancement paves the way for transformative applications across diverse domains, including augmented reality, autonomous vehicles, smart cities, and the Internet of Things (IoT) [3]. Among the notable developments within the 5G ecosystem is the emergence of Non-Public Networks (NPNs), which are tailored to meet the unique needs of industries, enterprises, and private organizations [4]. NPNs offer enhanced control, security, and customization options often unavailable in public 5G environments, making them ideal for industrial automation, innovative infrastructure, healthcare, and logistics applications. These characteristics ensure improved reliability, minimized latency, and

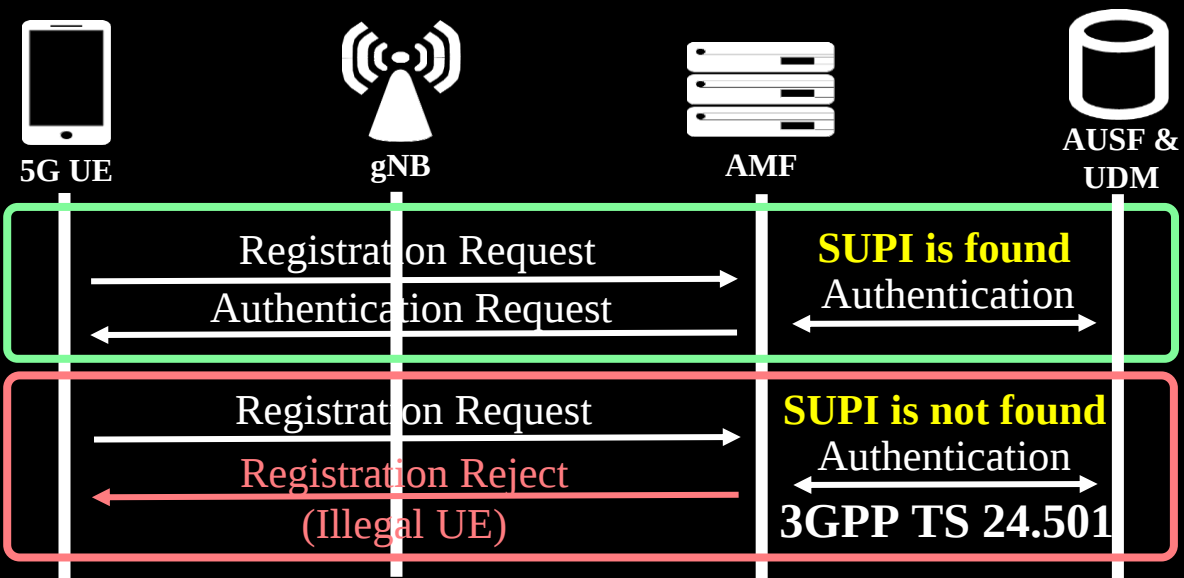

enhanced data confidentiality—essential for mission-critical operations [5].

However, a central challenge in NPNs is the safeguarding of sensitive subscriber information, particularly the Subscription Permanent Identifier (SUPI), within the 5G Core (5GC) Unified Data Management (UDM) database. The SUPI serves as a unique identifier for each subscriber in the 5G network, making it an attractive target for cyberattacks. Unauthorized access to SUPI data can lead to severe privacy breaches, enabling attackers to track users, intercept communications, or manipulate network access controls.

The limitations of existing 3GPP standards [6, 7] are particularly evident in NPNs, which are more vulnerable to targeted attacks such as multi-UE guessing attacks [8]. Although quantum security [9] has been introduced into Section 5.2 of 3GPP TS 33.107, the measures intended to mitigate the threat of quantum computing cannot solve the SUPI guessing problem. Continued reliance on traditional cryptographic techniques exacerbates these vulnerabilities, leaving NPNs exposed to sophisticated threats. Such attacks can compromise network security and data integrity, posing significant risks to critical network operations.

Implementing 5G in NPNs requires robust security measures. It prevents the sending of a Registration Request message with the cause "illegal UE" after receiving multiple Registration Request messages using a null-scheme containing a SUPI not found in the UDM database. Compared with the past, this method can effectively prevent multi-UE guessing attacks.

Furthermore, adaptive security mechanisms are needed for managing risks associated with unauthorized SUPI access. As 5G technology evolves, it will be necessary to research innovative security strategies, such as post-quantum cryptography protocols [9], to protect SUPI data against emerging threats. The continuous development of global policies and standards will also play a critical role in ensuring that NPNs maintain a strong

■ Accept with Minor Revisions (06-Feb-2025)

Secure Handling of Registration Request

The setup replicates an SNPN within an emulated private network using GitHub Codespaces. It uses Python-based gNB and 5GC emulators, developed with P1 Security's pycrate library, to simulate the operator's infrastructure. If a Registration Request with a SUPI not found in the UDM database is received, an Authentication Request is issued instead of a Registration Reject with the cause "Illegal UE."

Demonstration of SUPI Security Mechanisms

Our implementation replicates an emulated private network environment using a Python-based 5GC emulator to simulate the operator's infrastructure. These emulators are developed using P1 Security's pycrate Python library.

We recommend that the 5GC trigger an alarm to the network operator and refrain from sending a Registration Reject with the cause "Illegal UE" after receiving multiple Registration Request messages.

Reviewer's Comment

1. Comment 3: In 2-3 sentences, talk about security aspects of your work including connections with **post quantum crypto KEMs** and **signatures**. **NTT** is an important topic to consider.
2. Comment 4: How about future work, it gives motivation so add that in 2-3 bullets. Related to PQC, there is a **2023 competition by NIST for signatures**. For example, **Raccoon** is promising. Connect your work to that.
3. Comment 7: Add a paragraph, how about **fault detection** and **cryptography**, how about the notion of **SCAs** and combined attacks and countermeasures, relate that to your work in one paragraph.
 - Last but not least, I would like you to comment about accurate power derivation using **VCD** or **SAIF** as well as **energy consumption**.
 - Overall, your work will be enhanced addressing the above for another round of review. You can also talk about HW SW co-design using **Xilinx AMD Versal 2**.

Abstract

In this paper, we determine the question of how to perform an effective side-channel analysis (SCA) on real-world crypto products with proprietary side-channel countermeasures. We completely answer this question by modeling the system as an adversarial Deep-Learning based SCA model, and propose a series of analysis methods and various steps to instantiate the side-channel countermeasures. We take the analysis of a practical example, to discuss how to efficiently break the side-channel countermeasures. Then, we extend the analysis to other real-world crypto products, including 4G Universal Subscriber Identity Module (USIM) cards, showing the embedded side-channel countermeasures are not effective. The experiment results show that the side-channel countermeasures can be fully recovered without prior knowledge of side-channel countermeasures. This research allows us to provide a living case study of the physical security analysis of real-world crypto products, which might be worthy of more in-depth investigations.

DISCUSSIONS ON SIDE-CHANNEL VULNERABILITIES AND SHORTCOMINGS

This study enhances SUPI security in 5G NPNs, but certain limitations must be addressed, particularly regarding real-world implementation and scalability. The simulated environment used to evaluate quantum-safe mechanisms simplifies network interactions, failing to capture scalability challenges, dynamic key exchanges, and operational diversity. While this research focuses on SUPI guessing attacks, it does not fully explore hybrid cryptographic schemes, SUCI decryption resilience, or real-time key exchanges. Future work should incorporate field trials to validate quantum-safe frameworks and investigate hybrid encryption models that combine post-quantum and traditional cryptographies for better security and adaptability.

Fault attacks (FAs) remain a significant concern, exploiting electromagnetic interference, voltage fluctuations, and clock manipulation, leading to side-channel vulnerabilities. Despite the growing adoption of PQC, GSMA guidelines [9] do not explicitly address SUCI decryption security in SIM cards, creating risks of side-channel leakages. Future implementations should integrate hardware-based countermeasures, including cryptographic co-processors, real-time anomaly monitoring, and fault detection mechanisms, ensuring protection in resource-constrained environments like SIM cards.

Decomposing Prime Numbers with Shor's Algorithm: A GitHub Copilot Code Generation

GPT-4o

Question

Decomposing Prime Numbers using Shor

Sure! Below is an example Python script that demonstrates decomposing prime numbers using Shor's algorithm. Shor's algorithm is a quantum algorithm for integer factorization that runs in polynomial time. It can efficiently find the prime factors of a composite number.

The following code uses the `qiskit` library to implement Shor's algorithm:

```
<> shor_algorithm.py v1  
  
import numpy as np  
from qiskit import QuantumCircuit, Aer, execute  
from qiskit.algorithms import Shor  
from qiskit.utils import QuantumInstance
```

Answer

Explanation:

1. Import necessary libraries: Import `numpy`, `qiskit`, and other necessary modules.
2. Define `run_shors_algorithm` function: This function sets up the quantum instance, runs Shor's algorithm, and prints the result.
3. Set up the quantum instance: Use the `Aer` simulator backend from Qiskit.
4. Run Shor's algorithm: Create an instance of `Shor` and run it with the provided number `N`.
5. Print the result: If prime factors are found, print them; otherwise, indicate failure.
6. Main block: Define the number `N` to decompose and call the `run_shors_algorithm` function.

Executing Code Generated by GitHub Copilot: Encountering Error Messages

The screenshot shows a Jupyter Notebook interface in a Codespaces environment. The notebook is titled "Shor Example.ipynb". The code cell contains a Python script that imports necessary libraries and defines a function to run Shor's algorithm. The code is as follows:

```
import numpy as np
from qiskit import QuantumCircuit, Aer, execute
from qiskit.algorithms import Shor
from qiskit.utils import QuantumInstance

def run_shors_algorithm(N):
    # Set up the quantum instance
    backend = Aer.get_backend('qasm_simulator')
    quantum_instance = QuantumInstance(backend, shots=1000)

    # Run Shor's algorithm
    shor = Shor(quantum_instance=quantum_instance)
    result = shor.factor(N)

    # Print the result
    if result.factors:
        print(f"Prime factors of {N} are {result.factors}")
    else:
        print(f"Failed to find the prime factors of {N}")

if __name__ == "__main__":
    # Example: Decompose the number 15
    N = 15
    run_shors_algorithm(N)
```

The code is highlighted with a yellow box, and a yellow callout bubble labeled "Source Code" points to it. Below the code cell, the output shows an error message:

```
[1]
...
ImportError                                Traceback (most recent call last)
Cell In[1], line 2
      1 import numpy as np
----> 2 from qiskit import QuantumCircuit, Aer, execute
      3 from qiskit.algorithms import Shor
      4 from qiskit.utils import QuantumInstance

ImportError: cannot import name 'Aer' from 'qiskit' (/usr/local/python/3.12.1/lib/python3.12/site-packages/qiskit/__init__.py)
```

The error message is highlighted with a white box, and a white callout bubble labeled "Result" points to it. The bottom of the interface shows the Codespaces status bar with the text "Codespaces: refactored journey" and a small icon.

Re-generating Code with GitHub Copilot to Eliminate Error Messages

Question

GPT-4o

ImportError Traceback (most recent call last)

Cell In[1], line 2

```
1 import numpy as np
----> 2 from qiskit import QuantumCircuit, Aer, execute
      3 from qiskit.algorithms import Shor
      4 from qiskit.utils import QuantumInstance
```

ImportError: cannot import name 'Aer' from 'qiskit'
(/usr/local/python/3.12.1/lib/python3.12/site-packages/qiskit/__init__.py)

Answer

It seems that there might be an issue with the import of the `Aer` module from `qiskit`. This could be due to several reasons such as version compatibility or installation issues.

Let's ensure that you have the correct version of `qiskit` installed and that you are using the correct imports. Here is an updated version of the script with proper imports and instructions to install `qiskit-aer` if it is not already installed.

```
<> shor_algorithm.py v1
```

```
import numpy as np
from qiskit import QuantumCircuit, execute
from qiskit.providers.aer import Aer # Ensure correct import for Aer
from qiskit.algorithms import Shor
from qiskit.utils import QuantumInstance
```

Executing Re-generated Code by GitHub Copilot: Facing Error Messages Again

The screenshot shows a Jupyter Notebook interface with a dark theme. The top bar includes navigation icons and tabs for 'Shor Example.ipynb'. The notebook content is divided into two main sections: a code cell and an output cell.

Source Code

```
import numpy as np
from qiskit import QuantumCircuit, execute
from qiskit.providers.aer import Aer # Ensure correct import for Aer
from qiskit.algorithms import Shor
from qiskit.utils import QuantumInstance

def run_shors_algorithm(N):
    # Set up the quantum instance
    backend = Aer.get_backend('qasm_simulator')
    quantum_instance = QuantumInstance(backend, shots=1000)

    # Run Shor's algorithm
    shor = Shor(quantum_instance=quantum_instance)
    result = shor.factor(N)

    # Print the result
    if result.factors:
        print(f"Prime factors of {N} are {result.factors}")
    else:
        print(f"Failed to find the prime factors of {N}")

if __name__ == "__main__":
    # Example: Decompose the number 15
    N = 15
    run_shors_algorithm(N)
```

Result

```
ImportError                                Traceback (most recent call last)
Cell In[4], line 2
      1 import numpy as np
----> 2 from qiskit import QuantumCircuit, execute
      3 from qiskit.providers.aer import Aer # Ensure correct import for Aer
      4 from qiskit.algorithms import Shor

ImportError: cannot import name 'execute' from 'qiskit' (/usr/local/python/3.12.1/lib/python3.12/site-packages/qiskit/__init__.py)
```

Select Kernel

factor integers into their prime factors, and prime numbers by definition have no non-trivial factors. Here's a Python implementation that simulates Shor's algorithm. Note that a true quantum implementation would require a quantum computer (e.g., using Qiskit), but this classical simulation illustrates the logic. I'll use a simplified version with modular arithmetic and the quantum period-finding concept approximated classically.

```
import random
import math

def gcd(a, b):
    """Compute the Greatest Common Divisor of a and b."""
    while b:
        a, b = b, a % b
    return a

def modular_exp(base, exponent, modulus):
    """Efficient modular exponentiation."""
    result = 1
    base = base % modulus
    while exponent > 0:
        if exponent & 1:
            result = (result * base) % modulus
        base = (base * base) % modulus
        exponent >>= 1
    return result

def is_prime(n):
    """Check if a number is prime."""
    if n < 2:
        return False
    for i in range(2, int(math.sqrt(n)) + 1):
        if n % i == 0:
```

factors.

5. **Retry Logic:** If period finding fails or yields invalid results, the algorithm retries with a new `a`.

Limitations:

- This is a classical simulation, so it's inefficient for large numbers (Shor's algorithm shines on quantum hardware).
- For large `N`, the period-finding step would be infeasible classically but is polynomial-time on a quantum computer.
- Works best with small composite numbers like 15 (3×5) or 21 (3×7).

Example Output for N = 15:

text

✕ Collapse ≡ Wrap 📄 Copy

```
Attempting to factor 15
Randomly chosen a = 7
Found period r = 4
Factors found: 3 and 5
Final factors: 3 and 5
```

Let me know if you'd like a quantum-specific version (e.g., with Qiskit) or further refinements!

 INSTITUTE FOR INFORMATION INDUSTRY

Factors found: 3 and 5
Final factors: 3 and 5

Collapse Wrap Copy

Notes:

- **Scalability:** This works for small numbers (e.g., 15, 21) due to simulator limitations. Factoring large numbers requires a real quantum computer with many qubits and low noise.
- **Simplifications:** The modular exponentiation is simplified; a full quantum implementation would use a gate sequence for $a^x \bmod N$.
- **Retries:** If the period is invalid (odd or doesn't yield factors), it retries with a new a .

Let me know if you'd like to refine this further or adapt it for a specific quantum backend!

50 mod_exp = modular_exp_circuit(a, N, n_count)
--> 51 circuit.append(mod_exp, range(n + n_count))
53 circuit.append(QFT(n_count, do_swaps=False).inverse(), range(n_count))
55 circuit.measure(range(n_count), range(n_count))

File /workspaces/next-generation-network/.venv/lib/python3.12/site-packages/qiskit/circuit/quantumcircuit.py:2558, in QuantumCircuit.append(self,
2552 broadcast_iter = (
2553     operation.broadcast_arguments(expanded_qargs, expanded_cargs)
2554     if isinstance(operation, Instruction)
2555     else Instruction.broadcast_arguments(operation, expanded_qargs, expanded_cargs)
2556 )
2557 base_instruction = CircuitInstruction(operation, (), ())
--> 2558 for qarg, carg in broadcast_iter:
2559     self._check_dups(qarg)
2560     instruction = base_instruction.replace(qubits=qarg, clbits=carg)

File /workspaces/next-generation-network/.venv/lib/python3.12/site-packages/qiskit/circuit/instruction.py:593, in Instruction.broadcast_arguments
588 raise CircuitError(
589     f"The amount of qubit arguments {len(qargs)} does not match"
590     f" the instruction expectation ({self.num_qubits})."
591 )
592 if len(cargs) != self.num_clbits:
--> 593 raise CircuitError(
594     f"The amount of clbit arguments {len(cargs)} does not match"
```

Re-generating Code with Grok to Eliminate Error Messages

The `CircuitError` you're encountering arises because the `modular_exp_circuit` function creates a `QuantumCircuit` with classical bits (clbits) that are not properly handled when appended to the main circuit in `shors_algorithm_qiskit`. Specifically:

- `modular_exp_circuit` defines a circuit with `n + n_count` qubits and `n_count` clbits, but when it's appended to the main circuit (which also has `n_count` clbits), Qiskit expects the number of classical bits in the instruction to match the number provided in the `cargs` argument of `circuit.append`. By default, no `cargs` are provided, leading to a mismatch (0 clbits provided vs. `n_count` expected).

To fix this, we need to:

1. Ensure the `modular_exp_circuit` doesn't include unnecessary clbits, since we're not measuring within that subcircuit.
2. Properly specify both qubit and clbit arguments when appending the circuit if clbits are involved, or adjust the circuit construction to avoid this mismatch.

Here's the corrected version of the code:

python

✕ Collapse

≡ Wrap

📄 Copy

```
from qiskit import QuantumCircuit
from qiskit.circuit.library import QFT
from qiskit_aer import AerSimulator
import math
import random

def gcd(a, b):
    """Compute the Greatest Common Divisor of a and b."""
    while b:
        a, b = b, a % b
```

Conclusion

- The rise of quantum computing poses real threats to 5G identity protection, especially SUCI encryption based on ECIES. As shown in our emulation experiments, vulnerabilities exist that could be exploited once quantum capabilities mature.
- To build resilience, migration to Quantum Safe Networks (QSN) is necessary—incorporating Post-Quantum Cryptography (PQC) and Quantum Key Distribution (QKD). We actively engage with 3GPP and GSMA to align with future 6G standards.

Conclusion

- Our study also explores the potential of IBM Qiskit, which allows simulation of quantum algorithms like Shor's, helping assess actual risks.
- In parallel, we demonstrate how Generative AI, such as GitHub Copilot, can aid rapid quantum code prototyping and learning—though iterative validation remains crucial.
- Together, quantum technologies and AI tools offer new ways to enhance network security, accelerate R&D, and shape a trustworthy communication future.
